AB The invention relates to the discovery that various proteins isolated from ticks are effective in the treatment and prevention of allergic rhinitis. These proteins may most suitably be applied to an effected area and are thus effective to treat this condition and to ameliorate its symptoms. Human subjects were challenged with histamine and then were treated with histamine-binding protein, **MS-HBP1**.

AB High-affinity histamine-binding proteins (HBPs) were discovered in the saliva of Rhipicephalus appendiculatus ticks. Their ability to outcompete histamine receptors indicates that they suppress inflammation during blood feeding. The crystal structure of a histamine-bound HBP, detd. at 1.25 .ANG. resoln., reveals a lipocalin fold novel in contg. two binding sites for the same ligand. The sites are orthogonally arranged and highly rigid and form an internal surface of unusual polar character that complements the physicochem. properties of histamine. As sol. receptors of histamine, HBPs offer a new strategy for controlling histamine-based diseases.

AB The present invention relates to histamine and serotonin binding mols. that possess a binding site with the precise mol. configuration that is necessary to confer on the mol. a high affinity for histamine. The invention includes proteins, peptides and chem. compds. that possess this mol. configuration and that are thus able to bind to histamine with high affinity. These mols. may be used in the regulation of the action of histamine or serotonin, the detection and quantification of histamine or serotonin and in the treatment of various diseases and allergies. The mols. may also be used as components of vaccines directed against blood-sucking ectoparasites. Vasoactive amine binding proteins (VABPs) are provided that specifically bind to vasoactive amines with a dissocn. const. of <10-7 M and which belong to the same protein family as **MS-HBP1**, **FS-HBP1**, **FS-HBP2** and D.RET6. Thus, 11 VABPs were isolated, and their cDNAs cloned and sequenced, from ticks: **FS-HBP1** (female-specific histamine-binding protein 1), **FS-HBP2** (female-specific histamine-binding protein 2), **MS-HBP1** (male-specific histamine-binding protein 1), and Ra-Res from Rhipicephalus appendiculatus; D.RET6 from Dermacenter reticularis; Av-HBP from Amblyomma variegatum; and 5 related Ih/Bm-HBP proteins from a mixed Ixodes hexagonus/Boophilus microplus cDNA expression library. These VABPs possess similar amino acid sequences and predicted secondary structures.

The VASPs bind histamine in mammals, and can be used as anti-inflammatory agents to regulate histamine action and to control its pathol. effects. The crystal structure of **FS-HBP2** to 2.24 .ANG. resoln. was used to design a synthetic cyclic octapeptide (-Ala-Glu-Ala-Phe-Ala-Glu-Ala-Trp-) with histamine binding activity.

AB Structure-activity relationships of tetrandrine, isolated from a Kampo medicine, Stephania tetrandrae S. Moore (root), and related synthetic compds., were investigated in in vitro fetal bovine serum (FBS)-stimulated angiogenesis of cultured choroids in streptozotocin-diabetic Wistar rats, and air-pouch granuloma angiogenesis in vivo in diabetic mice. Tetrandrine, KS-1-1 (6,7-dimethoxy-1-[[4-[5-(6,7-dimethoxy-2-methyl-1,2,3,4-tetrahydroisoquinolinyl)methyl-2-methoxy]phenoxy]benzyl]-2-methyl-1,2,3,4-tetrahydroisoquinoline), and KS-1-4 (6,7-dimethoxy-1-[[4-[4-(6,7-dimethoxy-2-methyl-1,2,3,4-tetrahydroisoquinolinyl)methyl]phenoxy]benzyl]-2-methyl-1,2,3,4-tetrahydroisoquinoline), potently inhibited choroidal angiogenesis and air-pouch granuloma angiogenesis in the diabetic state. Their inhibitory effects on diabetic choroids were greater than those on normal choroids. Among these compds., KS-1-4 inhibited only diabetic angiogenesis. These compds. significantly inhibited FBS-stimulated tube formation in vascular endothelial cells from normal rats. Tetradrine and KS-1-4, but not KS-1-1, inhibited vascular endothelial growth factor- and platelet-derived growth factor-BB-stimulated angiogenesis in normal choroids. The bis[tetrahydroisoquinoline] moiety, connected by oxy-bis[phenylenemethylene] and 2,2'-dimethyl groups in tetrandrine, contributes to the inhibition of diabetic choroidal angiogenesis. KS-1-4 may be a candidate for anti-choroidopathy and retinopathy drugs in the diabetic state.

DOCUMENT TYPE: Journal
LANGUAGE: English
AB The compatibility of doxorubicin hydrochloride liposome injection with selected other drugs during simulated Y-site administration was studied. Five milliliters of doxorubicin hydrochloride liposome injection 0.4 mg/mL in 5% dextrose injection was combined with 5 mL of each of 82 other drugs in 5% dextrose injection or, if necessary to avoid incompatibilities with the diluent, 0.9% sodium chloride injection. The combinations were examd. with the unaided **eye** in fluorescent light and in high-intensity monodirectional light to enhance visualization of small particles and low-level turbidity. The turbidity of each combination was measured as

well. Particle sizing and counting were performed on selected combinations. Evaluations were performed initially and at one and four hours. All combinations were stored at room temp. (.apprx.23 .degree.C). Most of the test drugs were compatible with doxorubicin hydrochloride liposome injection during the four-hour observation period. However, practitioners should be cautious in administering any drug simultaneously with doxorubicin hydrochloride liposome injection until the integrity of the liposomes can be verified. Eighteen drugs exhibited unacceptable increases or decreases in measured turbidity or particulate formation within four hours. During simulated Y-site administration, doxorubicin hydrochloride 0.4 mg/mL (as the liposomal injection) in 5% dextrose injection was compatible with 64 of 82 other drugs for four hours at .apprx.23 .degree.C and was incompatible with 18 of the test drugs.

AB The compatibility of remifentanil hydrochloride with 90 other drugs during simulated Y-site administration was studied. Five milliliters of remifentanil 25 and 250 .mu.g/mL (as hydrochloride) in 0.9% sodium chloride injection or 5% dextrose injection was combined with 5 mL of each of 90 other drugs in 5% dextrose injection or 0.9% sodium chloride injection. Each combination was prepd. in duplicate. The combinations were stored at .apprx.23 .degree.C under fluorescent light and examd. with the unaided **eye** and in high-intensity monodirectional light during the first 15 min after prepn. and at one and four hours. The turbidity of each combination was measured as well. Particle sizing and counting were performed for selected combinations. Most of the combinations exhibited no haze, turbidity, or color change throughout the study period. Remifentanil 25 .mu.g/mL combined with chlorpromazine hydrochloride showed a small increase in haze within four hours. One of the combinations of remifentanil 250 .mu.g/mL with cefoperazone sodium was un-acceptably hazy within one hour. The combination of remifentanil 250 .mu.g/mL with amphotericin B formed a gross ppt. upon mixing. Remifentanil 25 and 250 .mu.g/mL (as hydrochloride) in 0.9% sodium chloride injection was compatible for four hours at .apprx.23 .degree.C with all the drugs studied except chlorpromazine hydrochloride (with remifentanil 25 .mu.g/mL), cefoperazone sodium (with remifentanil 250 .mu.g/mL), and amphotericin B (with remifentanil 250 .mu.g/mL in 5% dextrose injection).

AB Five-milliliter samples of thiotepa (lyophilized) (1 mg/mL in 5% dextrose soln.) were combined with 5 mL each of 100 other drugs, including antineoplastics, anti-infectives, and supportive care drugs, in 5% dextrose or 0.9% NaCl. The combinations were stored at room temp. (.apprx.23.degree.) under const. fluorescent light. Visual examns. were performed with the unaided **eye** immediately and after 1 and 4 h and, if there was no obvious incompatibility, with a high-intensity monodirectional light beam to enhance visualization of small particles and low-level turbidity. The turbidity of each combination was measured as well. Particle sizing and counting were performed on selected solns. Two drugs exhibited incompatibilities with thiotepa. The thiotepa-cisplatin combination developed turbidity in 4 h, and the thiotepa-minocycline-HCl combination developed a bright yellow-green discoloration in 1 h. All the other test drugs were compatible with thiotepa for at .gtoreq.4 h at room temp.

Abstract (Basic): WO 200115719 A2
NOVELTY - Employing a histacalin protein for treating or preventing conjunctivitis , or for manufacturing a medicament for treating or preventing conjunctivitis .
DETAILED DESCRIPTION - INDEPENDENT CLAIMS are included for the following:
(1) use of a histacalin protein in the manufacture of a medicament for treating or preventing conjunctivitis ;

Searched by Mona Smith

(2) a pharmaceutical composition comprising a histacalin protein , an antihistamine and a pharmaceutical carrier; and

(3) a method for treating or preventing conjunctivitis comprising administering to a subject a dose of the histacalin protein or the pharmaceutical composition.

ACTIVITY - Anti-inflammatory; antiallergic; antihistamine; opthalmological.

MECHANISM OF ACTION - Histamine inhibitor.

USE - The histacalin protein , pharmaceutical composition or method is useful for treating or preventing conjunctivitis , which is non-infective. Preferably, these are useful for treating or preventing allergic conjunctivitis , e.g. seasonal or perennial allergic conjunctivitis (all claimed). These are also useful in treating or preventing vernal keratoconjunctivitis, giant papillary conjunctivitis or atopic keratoconjunctivitis. The histacalin protein may also be used as a diagnostic tool for evaluating the disease state of a patient suffering from non-infective conjunctivitis . Histacalin protein FS-HBP2 (designated EV131) ophthalmic solution was prepared in 1 % and 6 % concentrations from stock that contained approximately 2 mg EV131 and 50 microl dH2O. Treatment was with either saline, or with 1 % or 6 % EV131 using the rabbit model. Each rabbit was topically dosed in the right eye with 40 microl EV131, and the left eye with 40 microl saline. Five rabbits were dosed with 1 % EV131 and four rabbits were dosed with 6 % EV131. Ten minutes following dosing, 25 microl of 7.5 mg/ml of a solution of Compound 48/80 (a pro-inflammatory compound that promotes the release of allergy mediators, including histamine). A dose of 6 % EV131 was found to give optimum results of consistent reduction in inflammation as measured by hyperemia, chemosis, mucous discharge or lid swelling.

Abstract (Basic): WO 200116164 A2

NOVELTY - Employing a histacalin protein for treating or preventing allergic rhinitis, or for manufacturing a medicament for treating or preventing allergic rhinitis.

ACTIVITY - Antiinflammatory; antiallergic; opthalmological.

Three subjects were challenged intranasally with histamine at 0.5, 1.0, 2.0, 4.0 or 8 mg/ml concentrations. 45 minutes after the completion of the challenge, baseline measurements were taken. Then a histacalin protein MS-HBP1 (designated EV504) was administered as a fresh solution of pre-weighed aliquots of histacalin in phosphate buffered saline. The solution was administered by dropping from a pipette into each nostril. After a further 15 minutes, a repeat nasal histamine dose-response challenge was administered. The results were recorded as total nasal airway resistance, as measured by active posterior rhinomanometry, and by measurement of anterior nasal secretions. Results showed that anterior nasal secretions and nasal airway resistance was greatly reduced upon administration of the histacalin protein .

MECHANISM OF ACTION - Histamine inhibitor.

USE - The histacalin protein , the medicament or method is useful for treating or preventing allergic rhinitis, both seasonal and perennial allergic conjunctivitis (claimed).

Abstract (Basic): WO 9927104 A1

NOVELTY - Histamine or serotonin binding compounds (A), are new.

DETAILED DESCRIPTION - (A) has a dissociation constant of less than 10-7 M and a binding site that includes:

(a) Phe, Ile, or Leu at residue I, Trp at residue II, and Asp or Glu at II and IV where residues I-IV are positioned as in residues 103, 42, 39, and 82 of sequences (I) (190 aa, given in the specification) or (II) (190 aa, given in the specification), residues 107, 41, 38, and 78 of sequence (III) (200 aa given in the specification), or residues 122, 54, 50, and 95 of sequence (IV) (209 aa given in the specification).

INDEPENDENT CLAIMS are also included for the following:

(1) compounds as above with Phe or Ile at residue I, Trp at residue II, and Asp or Glu at residue III or IV of the binding site where residues I-IV are positioned according to residues 98, 137, 24, and 120 of sequences (I) or (II), residues 95, 138, 23, and 129 of sequence (III), or residues 112, 149, 35, and 135 of sequence (IV);

(2) a histamine binding compound capable of binding histamine or serotonin that has 2 binding sites, 1 as in (a), the other as in (1);

(3) a protein comprising Ra-Res of amino acid sequence (V) (207 aa, given in the specification), or an equivalent derivative or fragment;

(4) a protein comprising Av-HBP of amino acid sequence (VI) (178 aa, given in the specification), or an equivalent derivative or fragment;

(5) a protein comprising Ih/Bm-HBP1 of amino acid sequence (VII) (203 aa, given in the specification), or an equivalent derivative or fragment;

(6) a protein comprising Ih/Bm-HBP2 of amino acid sequence (VIII) (203 aa, given in the specification), or an equivalent derivative or fragment;

(7) a protein comprising Ih/Bm-HBP3 of amino acid sequence (IX) (285 aa, given in the specification), or an equivalent derivative or fragment;

(8) a protein comprising Ih/Bm-HBP4 of amino acid sequence (X) (284 aa, given in the specification), or an equivalent derivative or fragment;

(9) a protein comprising Ih/Bm-HBP5 of amino acid sequence (XI) (321 aa, given in the specification), or an equivalent derivative or fragment.

(10) a nucleic acid encoding a compound of claims (a) and (1)-(9);

(11) a vector containing the nucleic acid molecule of (10);

(12) a host cell transformed with the vector of (11); and

(13) a transgenic animal transformed by the nucleic acid of (11) or

the vector of (12).
ACTIVITY - Anti-inflammatory; antihistamine; antiallergic; anti-asthmatic; cytostatic; antimigrane; dermatological;
MECHANISM OF ACTION - Histamine and serotonin binding.
USE - The compounds are useful for regulating the action of histamine and serotonin (in e.g. inflammation and gastric acid secretion), the detection, quantification and removal of histamine or serotonin (in animals, plants, cell cultures, food materials, or humans) and in the treatment of various diseases and allergies (e.g. type I hypersensitivity reactions, urticaria, asthma, allergic rhinitis (hay fever), atopic dermatitis, insect bites and food and drug allergies, abnormal blood pressure, migraine, psychological disorders, respiratory disease, and coronary heart disease). Histamine may also be used to regulate cellular growth and tissue repair. The molecules may also be used as components of vaccines directed against blood-sucking ectoparasites.

Based on patent WO 9744451

Abstract (Basic): WO 9744451 A

Vasoactive amine binding proteins (VABP) that bind specifically to vasoactive amines (VA) with dissociation constant below 0.1 mu M and belong to the same protein family as MS - HBP1 ; FS - HBP1 or 2, or D . RET6 are new. Also new are (1) functional fragments and derivatives of VABP; (2) nucleic acid (I) encoding VABP or hybridising with the coding sequence; (3) cloning or expression vectors containing (I); (4) host cells transformed or transfected with these vectors; (5) transgenic animals containing (I).

USE - The host cells are used to produce recombinant VABP. VABP are used (i) to detect or quantify histamine (or other VA such as serotonin) in body fluids or cell culture supernatants, e.g. to monitor the effect of allergens; (ii) for binding VA, e.g. to remove histamine from blood, food, cell cultures etc.; (iii) as an antihistamine or anti-inflammatory agent, e.g. for treating insect, snake or scorpion bites or dermatitis, or as a carrier for slow release of histamine-related compounds; (iv) in vaccines to protect against metazoan parasites, especially in animals; (v) as reagents for studying inflammation, involvement of VA in ulcer formation or the immune response etc.

ADVANTAGE - VABP provide a more sensitive assay for histamine than low-affinity antibodies currently used. They may also be more effective and safer than conventional antihistamines.
